IMPACT CYBERSECURITY PARTNERS WITH GLOBAL VELOCITY

ST. LOUIS, MO – February 16, 2010 – Impact CyberSecurity - an Impact Technologies Company, has partnered with Global Velocity to introduce the GV-2010. By combining an application-aware firewall with deep packet inspection and control, the GV-2010 network appliance offers unprecedented awareness and control of the information moving across the network in order to block applications and prevent data leakage.

“Our client’s need to be able to better see what is happening on their high bandwidth networks. The GV-2010 uses high-speed, low latency, high efficacy pattern-matching to monitor or block applications and control content exchange,” said Tom Rohlifing, President of Impact CyberSecurity. “The GV-2010 enables Impact to classify and prioritize sensitive data and identify traffic patterns which can then be used to evolve the IT infrastructure to protect against data leaks.”

Global Velocity is an innovator in next generation networking security solutions. Their patent pending technologies combine hardware and software to create the industry’s first true wire speed content filter. Impact CyberSecurity offers world-class data leak prevention products and consultative services.

About Impact Technologies

Founded in 1990, Impact Technologies is a privately held corporation that delivers world class solutions in voice and data communication, safety and security. Impact Technologies is located in St. Louis, MO. For more information visit www.impacttech.com.
